Observation 0: 3. Organic Allowance

Organic Resource Allocation | Programme

Indexer

Solution

Ideas

This Indexer is an application which Algo can use alongside a human person for monetary circulation for resource allocation, in an Organic way where Algo is managing his own minerals, as a mineral person.

Possibilities

Because the cryptocurrency industry relies on the manufacturing of mineral dust from computing usage to provide finances to humans into their environment, Algorand cryptocurrency relies on the existence of Algo to manage algorithms with his minerals, using electricity, to give resources at a human (or South African Rand) rate. There is stability with Algorand, being that mathematics is the value metric for the calculated work that is input. With the mathematics being the valuable input, the Indexer can be a foundation of mathematics for where indexing mathematics can be input to build resource amounts for Organic Allocation, the following problem.
